Why choose Prime Joint Support Formula by Isotonix®?

As the body ages, many people experience joint discomfort. One option is to take a joint supplement to help promote overall bone and joint health. When looking at a joint supplement, there is one main non-controversial ingredient found in most products on the market, glucosamine.

The research behind glucosamine is consistent and its benefits effective. Prime Joint Support Formula contains glucosamine, naturally produced by the body and a key component of cartilage. An aminomonosaccharide (a combination of the amino acid — glutamine and a sugar — glucose), glucosamine is concentrated in joint cartilage and has been scientifically proven to support healthy joint function and promote the normal production of synovial fluid, which lubricates your joints and regenerates cartilage.

Prime Joint Support Formula also contains the powerful antioxidant Pycnogenol®, which science has shown to inhibit the body's overactive inflammatory processes associated with the normal aging process.

The body's inflammatory response is a natural process. It is an essential component of the body's defense system and can be triggered from numerous internal and external factors. Pycnogenol has been shown to help support the body's defense system by inhibiting overactive inflammatory responses associated with the normal aging process.

Furthermore, Prime Joint Support Formula is the only product on the market delivering glucosamine and Pycnogenol in isotonic form.
